

COLORIMETER

It is essential to check your water with a chlorine / pH colorimeter

It is desirable to have a colorimeter with pellets

1/ pills are less perishable than drops
with pellets

2/ pills are more precise than drops
and above all than strips

Take the box upside down and dive it into the water at 30 cm down from the surface.

Return the box to fill it with water.

Drop a pill "phenol" on the pH side (left).

Drop a pill "DPD" on the chlorine side (right).

For more precision do not touch pills with fingers.

Close the box (the remaining water is thrown out).

Shake the box until the pills are totally melted.

Place now the box upon a white surface (wall, garden furniture).

Check the colours obtained and compare it to indicated data.

In case of difference with the measures shown on your EX2012 calibrate pH helped by this guide.
